"First class support for human and robotic testers via a robust UI and API. Rather than piggybacking off the JIRA issue view, TM4J comes with a full drag & drop friendly UI for managing tests, runs, plans, and executions. The API allows our automation team to do all of their work in their favourite integrated development environment without ever opening Jira. The reporting is great from 1ft to 10,000ft - I believe there are 72 out of the box reports you can customize and work with. We trialled literally every plugin available for test management and TM4J really stands out from the crowd."
