Test Management for Jira Server

Test Management for Jira (TM4J) is the enterprise test management tool to plan, manage, and measure your entire testing life-cycle inside Jira for both agile and waterfall methodologies. TM4J offers scalability, availability and performance for mission-critical projects running on any Jira deployment (Cloud, Server and DataCenter). The quickest way to get your trial up and running is to work your way through this guide.

Benefits

- One platform for everyone - Jira as a single source of truth
- Flexible workflow to foster collaboration between teams using Traditional, Agile and DevOps development methodologies
- Up to 70 cross-project reporting and 60 gadgets for improved visibility
- Rich APIs for integration with Agile, DevOps and automation tools and frameworks

Features

- Hierarchical folders for managing and reusing testing assets across Jira projects, releases and sprints
- Test cases libraries with versioning, reusable test steps, parameters and test data
- Test plans and Test cycles for managing and tracking test execution cycles
- End-to-end traceability across test cases, requirements, test execution results and defects
- Environment management to track test results against any platform/environment
- Up to 70 cross-project reports, gadgets and Confluence Macros
- Global and project level settings for customisation and standardization
- Custom fields for test cases, test steps, test plans, test runs and test execution
- Migration utilities to import test cases from files or legacy test case management tools
- REST APIs for integration with test automation and DevOps tools
- BDD support for agile teams using Cucumber or any gherkin compatible tool
- CI Servers, DevOps tools, ScriptRunner and eazyBI integration

First Steps

- Getting started guides
- Role Based Guides
- Terms and concepts
- Common usage
- API and test automation
